

WHY ATMOSAIR WORKS BETTER THAN AN IONIZER OR “AIR PURIFIER”

In a normal stand-alone room ioniser, the air must first be sucked into the ioniser, where it is then passed through a series of filters. Then, the filtered air is blown out of the top of the ioniser.

The effectiveness of these units is limited by the ability and power of the ioniser fan’s to suck in air from across the room. That’s almost impossible to do in an average room, so these ionisers / air purifiers are of limited use.

Also, once the filters get clogged (and they clog quickly), they stop working. Then germs, viruses and bacteria will grow in the filters. Frequent and expensive filter changes are needed.

ProMedUSA Bi-Polar Ionizer

Millions of bi-polar ions (negative and positive ions) are blown out of the AirPro with it’s powerful fan and circulate through your entire room killing germs, bacteria, viruses, odours, mould, and removing smoke, haze, dust and PM2.5 particles from the air you breathe.

The ProMedUSA Bi-Polar Ioniser requires no frequent filter changes. Germs cannot breed inside our bi-polar unit.

Bi-Polar ionised air is blown out of the AirPro, allowing the ions to spread out through your entire space, from floor to ceiling and corner to corner.

These ions kill germs, bacteria, viruses, mould and yeast spores on contact. They destroy odours on contact. Dust, dirt, Haze, smoke and PM10, PM2.5 and PM0.3 particles coagulate and drop out of the air.

You will enjoy visibly cleaner indoor air which smells crisp, pure and truly “Swiss Mountain Top” fresh.
